

# File Packer Unpacker

- This project is used to perform packing and unpacking activity for multiple types of files.
- In case of Packing activity we maintain one file which contains metadata and data of multiple files from specified directory.
- In case of Unpacking activity we extract all data from packed files and according to its metadata we create all files.
- In this project we have to use Java as Front end as well as Backend for platform independency.

## Steps to develop above project

- Design one window which accept username and password from user for authentication purpose.

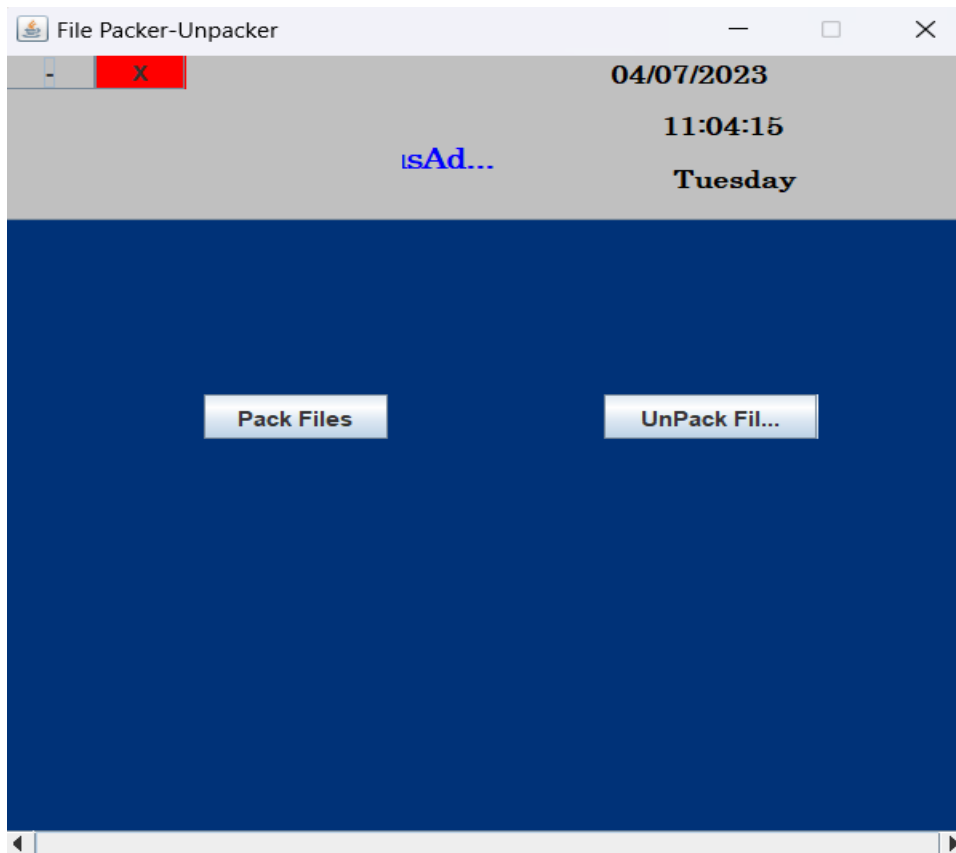

The screenshot displays a Java Swing window titled "File Packer-Unpacker". The window has a standard title bar with minimize, maximize, and close buttons. Below the title bar is a grey header area containing a red "X" button on the left, and the date "04/07/2023", time "11:02:59", and day "Tuesday" on the right. The main content area has a dark blue background. It features a login form with the following elements:

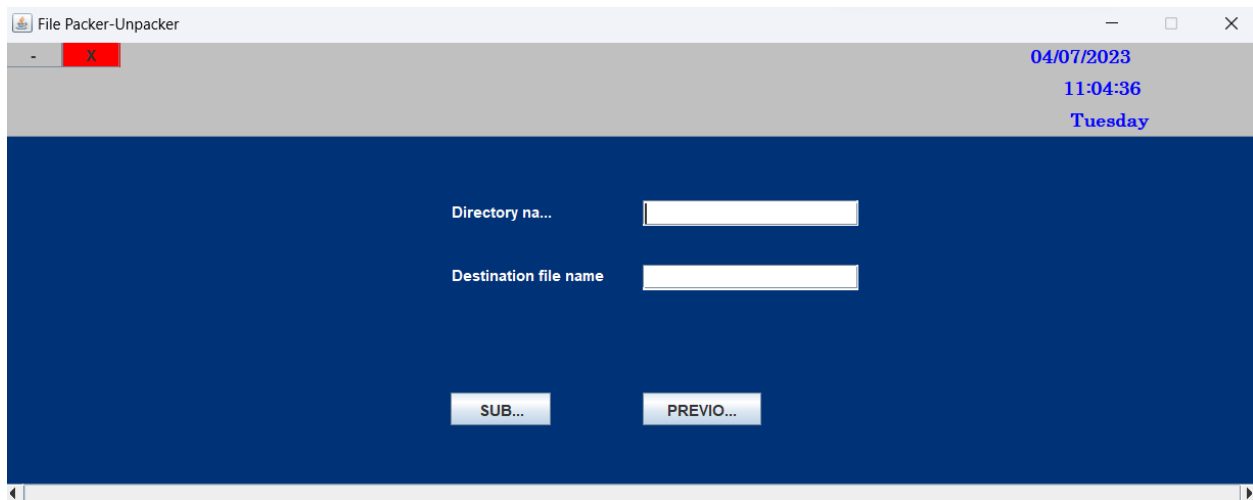

- A label "Inpacker: Login" in blue text.
- A label "Username:" followed by a white text input field.
- A label "Password:" followed by a white text input field.
- A light blue button labeled "SUB..." at the bottom left.

The window includes a horizontal scrollbar at the bottom.

- When user submit the username and password we have to check whether username is “**MarvellousAdmin**” and password is “**MarvellousAdmin**”.
- If password or username is incorrect then we have to provide 3 attempts to user. If user is unable to provide correct username and password in 3 attempts we have to close the project.
- For checking whether username and password contains minimum contains 8 letters or not we have to create one thread. That thread also check whether caps lock key is on or not.
- After successful authentication we have to open new window which displays two options as Pack and Unpack.

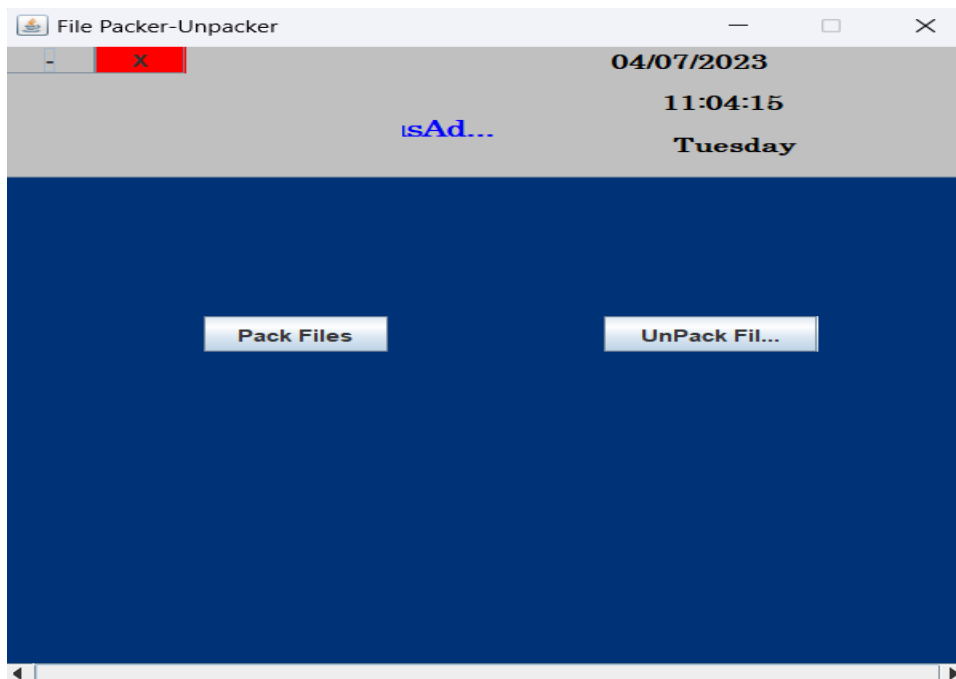

- When user press Pack button we have to open new window which looks like !

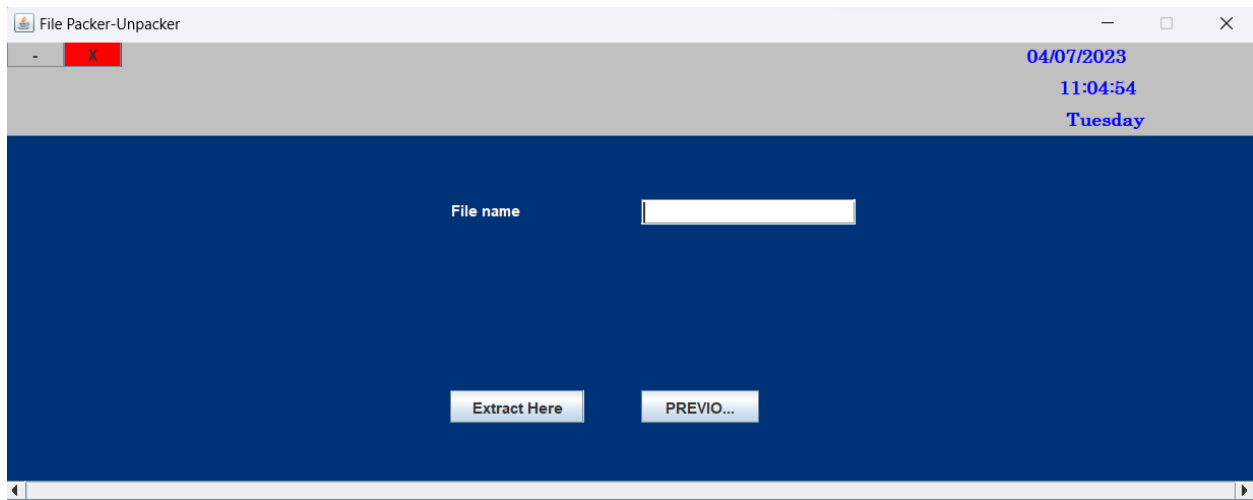

- From the above window we have to accept name of directory that we want to pack and name of the packed file from user.

- Name of the packed file gets newly created which contains data and metadata of all files from that directory.

- When user click submit button we have to perform "Packing Activity". After that previous window should be displayed as

- When user click Unpack button below window should be displayed as

- From this window accept name of packed file.

- When user click Extract Here button we have to perform “Unpacking Activity”.

## Backend Logic

### Packing Activity :

- In case of Packing activity we accept directory name and file name from user.
- We have to create new regular file as the name specified by the user.
- Now open the directory and traverse each file from that directory. In newly created file write Metadata as header and actual file data in sequence.
- While writing data perform encryption.
- Each name of file ,its size and checksum should be written in log file which gets created in system directory.
- After packing display packing report.

### UnPacking Activity :

- In case of UnPacking activity we accept packed file name from user.
- for authentication of packed file use any logic like Magic Number.

- Open the packed file in read mode and perform below activity as
- Read header
- From the name specified in header create new file.
- Write data into newly created file from packed file.
- Repeat all above steps till we reached at end of the file unpacked file.
- After unpacking display unpacking report.
